                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             g
                                                   The invention relates to a recombinant cellulase active protein free of proteinases of native thermophilic and alkalinophilic origin, comprising the truncated sequences Cell B5, Cell B45, Cell B1/5. Cell B1/3.

The truncated sequences Cell B5, Cell B5, Cell B1/5.

Cell 6 or Cell E3/B5, or a stability region from one of the defined full-cell b1/8.

Cell 6 or Cell E3/B5, or a stability region from one of the defined full-cell B1/8.

Cell 6 or Cell E3/B5, or a stability region from one of the defined from amino acid W135 in the sequence shown in AAY13492; Cell E1 extends from amino acid W133 to E1/2.

CEL/2.3 extends from amino acid W133 to E1/2 extends from manio acid W133 to E1/2.

CEL/2.3 extends from wanio acid W133 to E1/2 extends from manio acid W133 to E1/2.

CEL/2.3 extends from wanio acid W133 to E1/2 extends from manio acid W133 to E1/2.

CEL/2.3 extends from wanio acid W133 to E1/2 extends from manio acid W133 to E1/2.

CEL/2.3 extends from wanio acid W133 to E1/2 extends from manio acid W133 to E1/2.

CEL/2.3 extends from manio acid W133 to E1/2 extends from manio acid W133 to E1/2 extends from wanio acid W133 to E1/2 extends from acid W1340. The new consuming acid E4/B5 is shown in AAY13494. The new materials including cotton-containing fabrics. They are especially useful for processing of textiles where callulose breakdown is required. The new truncated enzymes show reduced redeposition of dye compared to using contruncated cellulase compositions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 56;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     489

The protein has amol. wt. of 81,000 (SDS-PAES) and an optimum pH near to 5 when carboxymethylcellulose is the substrate. The N-terminal sequence: GIHADT-has been confirmed by Edman degradation. The gene can be used to produce recombinant enzyme which is used for the effective utilisation of biomass resources and the mfr. of pharmaceuticals and foodstuffs, and also for the detergent and deinking of waste paper.

```
This invention relates to defence-related signalling genes isolated from the sunflower (Helianthus annuus). The genes encode a neoxanthin cleavage cargyme (MCE), an antho acid permease (AAP) and a glutemic acid rich protein (GRP). The signalling gene is useful for increasing the protein (GRP). The signalling gene is useful for increasing the casistance of a plant to a pathogen such as fungus, virus, bacterium, commande or insect (e.g. European corn borer), preferably schematode or insect (e.g. European corn borer), preferably construct containing the gene into the genome of the plant. The gene is construct containing deme expression in a plant, in response to a stimulus such as infection with a pathogen, damage from a pathogen, construct as infection with a pathogen, damage from a pathogen, constic acid or expression of a gene encoding oxalic acid or expression of a gene encoding oxalic acid oxidase. The constitution in the genes are also useful for stem-preferred regulation of gene expression in a plant. The genes are useful in agriculture, particularly in the chacing of crop plants with improved agronomic traits, for modifying abscisic acid (ABA) metabolism and for modifying manno acid transport and content in plants. The present sequence represents a glutamic acid rich sich such is special form Synechocystis sp. The protein is used in the characterisation of sunflower AAP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           46;

The invention relates to a recombinant cellulase active protein free of proteinases of native thermophilic and alkalinophilic origin, comprising the truncated sequences Cell B5, Cell B1, Cell E1/21, Cell 6 or Cell E3/B5, or a stability region from one of the defined full-cel for Cell B1/B5, or M1426, and Cell B4/5 extends from amino CC acid A1011 to P1424 or K1425 or N1426, and Cell B4/5 extends from amino CC acid K635 to N1426 in the sequence shown in AAY1349; Cell E1 extends from amino acid K33 to N1426 in the sequence shown in AAY1349; Cell E1/21 extends from amino acid K1331 to CK K1751 and the stability region extends from amino acid V1233 to CK K1751 and the stability region extends from mino acid E482 to G635 in the sequence shown in AAY13493; Cell E3/B5 is shown in AAX13494. The new CC enzymes are useful in laundry detergent compositions to prevent or remove staining, backstaining or graying, for use on cellulosic materials including oction-containing fabrics. They are especially useful for processing of textiles where cellulose breakdown is required. The new crucated enzymes show reduced redeposition of dye compared to using contrurcated enzymes show reduced redeposition of dye compared to using contrurcated enzymes show reduced redeposition of dye compared to using
                                                                                                                                              Cellulase; proteinase; truncated; Cel B5; Cel B4/5; Cel E1, Cel E1/2; Cel 1/2/3; Cel 6; Cel E3/B5; laundry detergent; stain-removing; cotton-containing fabric; stonewashing.

Key

Clostridium thermocellum.

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PRR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in retarting disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity amino acid sequences of data and products dependent on DNA and amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

This protein sequence represents a scaffoldin based on the Ciph protein of Clostridium thermocellum. The scaffoldin protein is used in a novel composition that comprises at least 2 enzymes non-covalently bound to a peptide backbone (i.e. present sequence). The scaffoldin comprises a number of internal repeating units and at least one cellulose binding domain (CBD) The CBD may be altered to modify its affinity for cellulose, which may be desirable where cellulose binding would be disadvantageous. The enzyme is bound to the scaffoldin by a dockerin region of the enzyme, which binds to a repeating element of the scaffolding. The dockerin is preferably CCBs (AAW15237) or Cell (AAW15236). The composition can be used in reducing allergenicity, producing synergistic effects, and facilitating selective modification of substrate. By taking advantage of the cellulose binding domain of the complex, the complex could be immobilised for use in chromatographic separations or for soluble substrate modification. By adding the caffolding domain, it is possible to recover enzymes, or to quantify the amount of an enzyme delivery system which could be used in the food industry, in food processing, animal feed, textiles, bioconversion, pulp and paper production, plant protection and best control, as a wood preservative, topical lotions, and biomass conversions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Composition with enzymes non-covalently bound to a peptide backbone - used as a multi-enzyme delivery system, e.g. in food processing,

```
Multimeric protein, especially enzymatic, complexes are held together by protein-protein interactions between domains designated dockerins and cohesins, which are found on the catalytic and scaffold subunits respectively. An example of such a complex is the cellulose degrading protein complex from clostridium thermocellum, known as the cellulosome. This complex comprises around 15 proteins including endoglucansses, cellobiohydratases, hemicallulases, e.g. xylanases or lichinases, which interact with a central "scaffold" protein designated the cellulosome interact with the cips subunit via conserved 23 amino acid dockerin compared to the subunit via conserved 23 amino acid dockerin compared to the isolation of proteins binding to a novel dockerin type domain found in the C-terminal portion of Cip. The new domain is designated a type II dockerin domain (as compared to the type I domain found on the catalytic subunits of the cellulosome). The type II dockerin domain has some sequence similarity to the type I dockerins but is unable to bind type I cohesin domains. The type II dockerin domain has some sequence similarity to the type I dockerins but is unable to bind type I cohesin domains. The type II dockerin type II dockerin type II dockerin sequence presented here is the cellulosome integrating protein (CIP-A) to which the proteins SdbA, OlpB and ORF2P (AAM43107) can bind at the C-terminal dockerin type II dockerin and cohesin domains can be used in complexes, especially enzyme complexes, to potentiate their used in complexes, especially enzyme complexes, to potentiate their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   559 KNWFQGSEPGGVTTGGTVAASADGSRFVWAPGDPGQPVVYAVGFGNSWAASQGVPANAQI 618

Multimeric protein, especially enzymatic, complexes are held together by protein-protein interactions between domains designated dockerins and cohesins, which are found on the catalytic and scaffold subunits respectively. An example of such a complex is the cellulose degrading protein complex from Clostridium thermocellum, known as the cellulosome. This complex comprises around 15 proteins including endoglucansaes, cellobiohydratases, hemicallulases, e.g. xylanases or lichinases, which interact with a central "scaffold" protein designated the cellulosome interact with the Cip subunit via consarved 23 amino acid dockerin domains. Cip has been shown to contain 9 copies of a cohesin domain. The invention relates to the isolation of proteins binding to a novel domain is designated a type II dockerin domain found in the C-terminal portion of Cip. The new domain has some sequence similarity to the type II dockerin domain has some sequence similarity to the type II dockerin domains. The sequence presented here is an example of a protein which binds the novel type II dockerin domains in the N-terminal portion of which the first domain and is the product of the oldby gene. The novel type II dockerin domains in the N-terminal portion of which the first domain (amino acid residues 28-19) is thought to bind cipa. The novel type II dockerin and cohesin domains can be used in complexes, especially enzyme complexes, to potentiate their catalytic actions in a synergistic manner.
                                                                                                                                                                          Multimer; enzyme; complex; protein-protein interaction; dockerin domain; cohesin domain; catalytic subunit; scaffold subunit; SdbA; synergistic; cellulosome integrating protein; scaffoldin dockerin binding protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cellulase proteins with cohesin or dockerin type II domains - useful for potentiating the activity of multiprotein enzyme complexes

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uvethis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; useltis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.

downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is the corrected version of the incorrect Bacillus lautus (NCIMB 40250) endoglucanase Endo 3A described in W09110732. Endo 3 can be used in novel method of forming localised colour density variation on the surface of a dyed cellulosic fabric. The method comprises agitating the fabric in an aqueous medium (PH 6.5 to 9.0) containing a family 5 cellulose, e.g. the present sequence, which can hydrolyse p-nitrophenyl-beta abrading agent or cellulose having abrading activity. Each cellulase displays 30 % or more of its maximum activity at pH 7. The process is useful to provide a stone washed look to blue jeans without back staining.
                                                                                                                                                    5
                                                                                                                                                                                                                                                                                                                                                                                                                      wash;

24; AAY81501 to AAY81679 represent specifically claimed protein sequences isolated from Streptococcus pneumoniae. AAA05407 to AAA05590 represent specifically claimed nucleotide sequences isolated from S. pneumoniae. The sequences have antibacterial and antihilammatory properties. The protein sequences, and fragments of them, are useful as immunogens and/or antigens. The nucleotide sequences can be useful as immunogens and/or antigens. The proteins and nucleotides can be useful for the detection and diagnostis of S. pneumoniae. The protein sequences are also useful for screening an agent capable of antagonising, inhibiting or interfering with the function or expression of the proteins in which the agent is useful for treatment or prophylaxis of S. pneumoniae infection and meningitis. AAA05591 to AAA05614 represent primers used in the exemplification of the present invention. pneumococcal diseases and for screening agents capable of antagonizing or inhibiting expression of the protein 305 350 595 386 655 442 530 sastsastsisasstvvgsqtaaateatakkveedrkkpasdyvasvtnvnlgsyakrrk 167 487 775 Gaps tstsasastsasasastsasasasisasesaststsasesastsasesastsas asastsasasastsasastsasastsasasastsasasastsasasasts STDSGATWSOMTNFPDVGTYIANPTDTTG------YOSDIOGVVWVAFDK----SSSSLGQASKTIFVGVADPNNPVFWSRDGGATWQAVPGAPTGFIPHKGVFDPVNHVLYI 168 rsvdsiegllasi-----knaavf----sgnt--ivngapa-----inaslni 303 ATSNTGGPYDGSSGD-----VWKFSVTSGTWTRISPVPSTDTANDYFGYSGLTIDRQH 205 akset-kvytgegvdsvyrvpiyyklkvtn------dgskltfty---tvtyvn PNTIMVATQISWWPDTIIFRSTDGGATWTRIWDWTSYPNRSLRYVLDISAEPWLTFGVQP pktndlgnissmrpgysiynsgtstqtmltlgsdlgkpsgvknyitdkngrqvlsyn---416 NPPVPSPKLGWMDEAMAIDPFNSDRMLYGTGATLYATNDLTKWDSGGQIHIAPMVKGLEE 476 TAVNDLISPPSGAPLISALGDLGGFTHADVTAVPSTIFTSPVFTTGTSVDYAELNPSIIV -----gltss-----wtvpi--tgtdtsf------536 RAGSFDPSSQPNDRHVAFSTDGGKNWFQGSEPGGVTTGGTVAASADGSRFVWAPGDPGQP 351 ---tftpyaartdri-----ginyfng-----gkvvessttsgsl-----sgs 596 VVYAVGFGNSWAASQGVPANAQIRSDRVNPKTFYALSNGTFYRSTDGGVTFQPVAAGLPS 387 kslsvsasgsasasastsasasasts---asasastsasasastsasvsastsasasas SGAVGVMFHAVPGKEGDLWLAASSGLYHSTNGGSSWSAITGVSSAVNVGFGKSAPGSSYP tsasa------sastsasesastsasasasasastsasasastsasastsase 716 AVFVVGTIGGVTGAYRSDDCGTTWVLINDDQHQYGNWGQAITGDHANLRRVYIGTNGRGI sastsasastsasesastsas----asastsasas---astsasass --- SSPVSGGVKVQYKNNDS 214; Length 1237; Score 219; DB 21; Length 12 Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the encoded proteins (AA000010-PA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The production of other optoxides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities of stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL36511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   696 sgssg-----lgnnvnvkgdt 729

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 5,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a human proteophosphoglycan protein designated hPPG-1. Also describes are methods for the preparation and detection of hPPG-1. The present sequence represents the Leishmania major PPG protein which is used in comparison with the hPPG-1 protein, in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    783 APSGSPS-PSVSPSASPSLS---PSPSSSSPSSPSPS-PSSSSPSSPSPSPSR 836

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 40,

Patent No. 6177084
GENERAL INFORMATION:
APPLICANT: FOSTER: Timothy J.
TITLE OF INVENTION: The S. aureus Fibrinogen Binding Protein Gene
TITLE OF INVENTION: 1999-10-19
CURRENT APPLICATION NUMBER: US/09/421,868
CURRENT FILING DATE: 1999-10-19
PRIOR FILING DATE: 1999-10-19
PRIOR FILING DATE: 1999-10-19
NUMBER OF SEQ ID NOS: 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 933;

Patent No. 5928902
GENERAL INFORMATION:
GENERAL THORMATION: Michel
APPLICANT: Cohen, Joseph
TITLE OF INVENTION: Hybrid Protein Between CS
TITLE OF INVENTION: from Plasmodium and HBsAG
NUMBER OF SEQUENCES: 4
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEDIUM TYPE: Diskette
COMPUTER: IBM Compatible
OPERATING SYSTEM: DOS
SOFTWARE: FASTSEO for Windows Version 2.0
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/760,797A
FILING DATE: 04-DEC-1996
CLASSIFICATION: 435
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ADDRESSEE: SmithKline Beecham Corporation

C; Species: Caenorhabditis elegans
C; Species: Caenorhabditis elegans
C; Accession: T34434
R; Geisel, C.; Gattung, S.
submitted to the EMBL Data Library, December 1996
A; Description: The sequence of C. elegans cosmid K06A9.
A; Reference number: 221525
A; Accession: T34434
A; Reference number: 221525
A; Residues: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: DNA
A; Molecule type: DNA
A; Mosicule type: DNA
A; Map position: X
A; Introns: 38/1; 75/3; 103/3; 132/2; 158/2; 222/1; 1088/1; 1367/1; 2039/1; 2075/

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution

105224

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt_40:*
